

# Sequencing Events in the Fossilisation Process

1) Cut out the description boxes and paste them into the correct order on the flow chart.

2) Paste the matching pictures next to the descriptions.

The soft parts of the fish begin to decay.

The remains of the fish absorb minerals which turn it into a stone like substance over a long time.

A fish dies and sinks to the ocean floor.

More layers of sediment build up over the fish's remains adding pressure.

Layers of sediment wash over the fish's body until it is completely covered.
